Update to VM ModController

We have now released an updated version of our module controller for Virtuemart, [VM ModController Pro](#)
.

This module allows you to control the display of other Joomla modules on Virtuemart pages. It allows you to assign modules to Virtuemart pages (including specific flypages or browse pages), categories, and shopper groups.

Version 1.0.1 of VM Modcontroller Pro now includes a fix for an issue that caused problems when more than one instance of the module was displayed on a page, plus a couple of other bug fixes.

Customers who have bought the old version of the module can download the new version using their old download id. After that, just upload and install it as normal using the Joomla installer.
